

Transaction reversal — “No shared source” explained

“Reverse all related entries” only works when several ledger lines were created from the **same business event** (same **reference** in the database). The helper text “**No shared source**” (now split into clearer messages) means **this row is not linked that way**, so only the single line you opened can be reversed.

When you see it

Situation	What it means
Manual Credit / Debit	Header actions post with no reference — standalone adjustment.
Refund	Master + member cash debits with no reference.
Reversal line	Reference points at another transaction (Transaction #123), not a Loan/Contribution. “Reverse all” is for unwinding a loan disbursement , not chaining reversals.
Loan / contribution / repayment / bank mirror	Should not show “no linked source”. You should see something like “Also reverses 2 other ledger line(s) tied to the same Loan #5...”.

How to check a row

Open **View** on the transaction and look at **Reference**:

- — (empty) → manual/unlinked → “No linked source...”
- **Reversal of #...** or reference is another transaction → reversal entry
- **Loan #5, Contribution #12, BankTransaction #...** → shared source; toggle should describe related lines

Example

Loan disbursement creates **3** lines (master fund debit, member fund debit, member cash credit), all with **reference** = that **Loan**. Reversing **any one** of those with the toggle on should reverse **all three**.

Manual credit on an account creates **one** line with **reference** = null → only that line can be reversed.

Helper text in the Reverse modal is now more specific (manual vs reversal vs multi-line source) so the reason is obvious on the row you’re on. If you expect a loan/contribution link but still see “no linked source”, note which transaction (description + account) and trace why **reference** was not stored.

Technical criteria (`canUseFullSourceReversal`)

Full-source reversal is available when:

- `reference_type` is set
- `reference_id` is set
- `reference_type` is **not** `Transaction::class` (i.e. not a reversal counter-entry)

Related ledger lines are found with:

```
WHERE reference_type = ? AND reference_id = ?
```

across **all accounts** (master fund, member fund, member cash, master cash, etc.).
