

FundFlow — Reconciliation & Scheduler

Accountant one-pager · Print or use as a 6-slide deck

Full reference: [fund-flow-reconciliation-and-scheduler.md](#)

Slide 1 — Three mechanisms (do not confuse them)

Mechanism	Command	Output	Your use
Realtime	(automatic on each Transaction)	Immediate exceptions	Catch drift at post time
Nightly batch	<code>fund:nightly-reconciliation</code>	Active exception queue	Active remediation
Audit snapshot	<code>fund:reconcile --daily / --monthly</code>	<code>reconciliation_snapshot</code>	Month-end audit PDF

Posting clearance reconciliation. Match/clear bank lines updates linkage — no extra cash journal when correct.

Slide 2 — Daily morning sequence (per tenant)

Time	Command	Purpose
06:00	<code>fund:assert-master-invariants</code>	Master cash/fund = Σ members
06:20	<code>fund:reconcile --daily</code>	Store yesterday's audit snapshot
06:30	<code>fund:nightly-reconciliation</code>	Full sweep + auto-resolve + halt gate
07:15	<code>contributions:apply-late-fees</code>	Late fee tiers (halt-sensitive)
08:00	<code>bank:auto-match</code>	Match imports uncleared postings

UI: Finance → Reconciliation (queue) · Audit & System → Jobs (manual re-run).

Slide 3 — Nightly batch flow

NIGHTLY_RECON_START

- clear exception queue (fresh sweep)
- master balanced? (tiny drift → rounding suspense)
- domain sweeps: contributions · loans/EMI · fund tiers · bank · late fees · member formulas
- attemptAutoResolve on open exceptions
- re-assert master balanced

NIGHTLY_RECON_COMPLETE

Critical halt: MASTER_IMBALANCE_UNRESOLVED → BatchPostingGate blocks collection/EMI/bank batch jobs until fixed.

Slide 4 — Realtime vs nightly checks

When	What	Example codes
Each transaction	Journal balance, member drift, master pool drift	UNBALANCED_ENTRY, MEMBER_*_DRIFT, MASTER_*_POOL_DRIFT
Nightly only	Workflow signals, bank pipeline, EMI state, fee tiers	PENDING_PAST_WINDOW_CLOSE, RECON_UNMATCHED_BANK_LINE, EMI_COLLECTED_LEDGER_MISSING

Realtime checks **skip** during `masterPoolMirrorInProgress()` — paired mirrors post in one logical operation.

Slide 5 — Monthly calendar (collection)

Day	Command	Effect
1st	<code>contributions:init-cycle</code>	Pending rows created
1st	<code>contributions:notify</code>	Due notifications
5th	<code>contributions:apply</code>	Batch cash → fund
6th	<code>loans:apply-repayments</code>	Batch EMI from cash
6th	<code>contributions:close-window</code>	Unpaid → overdue
2nd	<code>fund:reconcile --monthly</code>	Month audit snapshot

Between batch dates: any cash credit (deposit, import, disbursement) can trigger auto-collection via `onMemberCashIncreased`.

Slide 6 — Investigation quick path

Symptom → Reconciliation queue (read code + presenter hint)

- trace Transaction(s) in audit log
- bank clearing if cash-related
- correction (reverse / reclassify / journal / CLI repair)
- `fund:nightly-reconciliation` or wait for 06:30
- `fund:assert-master-invariants`

CLI	When
<code>fund:reconcile --realtime --no-store</code>	Point-in-time audit without saving
<code>accounting:rebuild-balances --dry-run</code>	Stored balance txn sum
<code>legacy:repair-excess-loan-repayments</code>	Repayments > fund-portion target
