

Master bank manual credits and fund flow

This document explains how **manual credits/debits on the master bank ledger** relate to **statement imports**, **master cash**, and **member cash**. It complements [fund-flow-implementation.md](#) and [collection_cycle_workflow.md](#).

UI locations

Screen	Tab / area	What it shows
Bank Accounts	Statement lines	Imported CSV rows (<code>bank_transactions</code>) — mirror and post-to-member actions
Bank Accounts	Master bank ledger	Account ledger (<code>transactions</code> on master bank) — manual credit/debit only
Bank Accounts	Statements	Import history
Master Accounts → Bank	Transaction History	Same master bank ledger as above
Master Accounts → Cash	Transaction History	Master cash ledger — manual credit with member tag pairs to member cash
Fund Postings	—	Member deposits — accept credits master cash + member cash

Legacy URLs using `?tab=transactions` open **Statement lines** (imports).

What a manual master bank credit does

A manual **Credit** or **Debit** on **Bank Accounts → Master bank ledger** (or **Master Accounts → Bank → Transaction History**) uses accounting kind `master_bank_shadow` (`AccountingService::postManualMasterBankShadow`).

Step	Without member tag	With member tag
Bank ledger	Credit or debit master bank	Same
Master cash	Same amount mirrored (credit/debit)	Same
Member cash	—	Same amount mirrored (credit/debit)
Collection	—	Auto-collection runs after credit (<code>ContributionCollectionCycleService::onMemberCash</code>)

Manual bank entries still do **not** create **Statement lines** rows or use **Mirror to cash / Post to member** on imports. Use CSV import when you need `bank_transactions` reconciliation.

Debit with a member tag checks both member cash and master cash balances before posting.

Reversing (“clearing”) manual master bank credits

There is no **Clear** action on master bank ledger entries.

To undo a mistaken manual credit:

1. Open **Bank Accounts → Master bank ledger** (or **Master Accounts → Bank → Transaction History**).
2. Use **Debit** for the same amount with a clear description (e.g. “Reversal of manual credit — ...”).

Then complete the deposit using one of the supported paths below. Do not also mirror an import for the same money unless you have reversed the manual bank entry (see [Avoid double-counting](#)).

Note: **Clear / Match on Statement lines** links an imported line to an uncleared fund-posting or membership bank placeholder (`is_cleared`). That is not the same as reversing a manual master bank ledger credit.

Path A — Member deposit (fund posting)

Use when a member has deposited money and you are recording it through the normal deposit workflow. Cash and member balances are updated on accept; bank CSV reconciles later.

1. **Fund Postings** — member submits a deposit (or an admin records one).
2. **Accept** the posting.
 - Credits **Master Cash** and the **member's cash** account.
 - Creates an **uncleared bank_transactions** row linked to the posting (for later bank match).
 - Does **not** require **Mirror to cash** on Statement lines first.
3. When the bank CSV is available: **Bank Accounts** → **Statement lines** → **Import statement**.
4. Match the import to the uncleared posting:
 - **Clear / Match** on the statement line, or
 - **Bank auto-match** (scheduled command) if enabled.

Service: `FundPostingService::accept()`, `FundPostingService::clearTransaction()`.

Path B — Bank statement first (import-driven)

Use when work starts from the CSV, not from a manual master bank ledger credit.

1. **Do not** leave manual master bank credits in place for the same deposits (or reverse them first).
2. **Bank Accounts** → **Statement lines** — import the CSV (`BankImportService`).
3. On each line with status **imported**: **Mirror to cash** (row or bulk).
 - Credits **master bank** and **master cash** (via `AccountingService::mirror()`).
 - Status: **imported** → **mirrored**.
4. On each **mirrored** line: **Post to member** and select the member.
 - Mirrors into **member cash** (no debit of master cash).
 - Status: **mirrored** → **posted**.

flowchart LR

```
import[Import CSV] --> mirror[Mirror to cash]
mirror --> post[Post to member]
```

Service: `FundFlowService::mirrorToCash()`, `FundFlowService::postToMember()`.

Path C — Direct cash credit (master cash + member in one step)

Use when cash is already at hand and you are not reconciling via a bank import line yet.

1. **Master Accounts** → **Cash** → **Transaction History**.

2. **Credit** — amount, description, and **Member tag** (required for pairing).
 - Posts a paired credit to **Master Cash** and **member cash** (`master_cash_tagged`).
 - May trigger contribution/settlement via `ContributionCollectionCycleService` after member cash increases.

Use this instead of a manual **master bank** credit when the goal is member balances, not only the bank ledger balance.

Service: `AccountingService::postManualCredit()` on master cash with member id.

Decision guide

Goal	Where to work	Action
Undo manual bank credits	Master bank ledger	Debit (reversal)
Member deposit (normal)	Fund Postings	Accept → import bank CSV → match/clear
From bank CSV only	Statement lines	Import → Mirror to cash → Post to member
Cash + member without CSV	Master Accounts → Cash ledger	Credit + member tag

Avoid double-counting

If you **manually credited master bank** and later **import the same deposit** and **Mirror to cash**, master bank can be credited **twice** for one deposit.

Either:

- **Reverse** the manual bank credit before mirroring the import, or
 - Do not mirror that import line if the manual entry was only a placeholder (prefer reversing and using Path A or B).
-

Accounting reference (high level)

Path	Master bank	Master cash	Member cash
Manual bank credit	Credit	Credit (shadow)	Credit if tagged
Manual bank debit (reversal)	Debit	Debit (shadow)	Debit if tagged
Fund posting accept	Uncleared placeholder row	Credit	Credit
Mirror to cash (import)	Credit (mirror)	Credit (mirror)	—

Path	Master bank	Master cash	Member cash
Post to member	—	—	Credit (mirror)
Manual master cash credit + member tag	—	Credit	Credit (paired)

For the canonical lifecycle diagram, see [fund-flow-implementation.md](#).
